## 'PHG47'

## 14A. Exhibit A. Origin and Breeding History

Pedigree: 041/MKSDTE)3221112

Pioneer line PHG47, Zea mays L., a yellow dent corn inbred, was developed by Pioneer Hi-Bred International, Inc. from the single cross 041 x MKSDTE C10 using the pedigree method of breeding. The inbred line 041 is a proprietary inbred line of Pioneer Hi-Bred International, Inc. MKSDTE C10 is a broad-based breeding population that had 10 cycles of recurrent selection prior to the time of crossing to 041 to begin the development of PHG47. Selfing and selection were practiced within the above cross for seven generations during the development of PHG47. The inbred line was developed at Mankato, Minnesota, with the F4 generation being grown at Homestead, Florida. During line development, the line was crossed to inbred testers for the purpose of estimating combining ability. Additional hybrid combinations have been evaluated and subsequent generations of the line were grown and hand pollinated with observations made for uniformity.

PHG47 has shown uniformity and stability for all traits as described in Exhibit C (form LSGS-470-28) - "Objective Description of Variety". PHG47 has been self-pollinated and ear-rowed a sufficient number of generations with careful attention paid to uniformity of plant type to assure genetic homozygosity and phenotypic stability. The line has been increased both by hand and in isolated fields with continued observations for uniformity.

No variant traits have been observed or are expected in PHG47.

## 14B. Exhibit B. Novelty Statement for 'PHG47'

PHG47 is most similar to the public inbred line OH43. PHG47 expresses earlier maturity and has faster grain drydown than does OH43. PHG47 reaches 50% silk emergence at 1360 heat units versus 1420 heat units for OH43. PHG47 also has a smaller and harder textured ear type than does OH43.

## 14D. Exhibit D. Additional Description of 'PHG47'

PHG47 is a yellow dent inbred line of corn, Zea mays L.

As an inbred per se, PHG47 is similar to the public inbred line OH43. However, there are some distinguishable differences between these two inbreds as stated in Exhibit B.

For maturity, PHG47 is similar to PHG29. When compared to PHG29 crossed to the same tester lines and evaluated at the same locations, PHG47 is 6% lower yielding, 2% dryer at harvest, has 8% poorer stalk quality, has 2% better root quality, is 15% poorer for late season plant health, is 13% better on cob strength, and is 4% shorter and 8% lower eared than PHG29.

For comparative purposes, data are attached with comparisons of PHG47 to Pioneer inbred line PHG29 (crossed to the same tester line and evaluated in the same locations).

14D. Exhibit D.

Comparison of PHG47 and PHG29 crossed to the same tester lines and the hybrids evaluated at the same locations. All values are expressed as percent of the test mean except yield, which is expressed as bushels/acre adjusted to 15.5% moisture.
